Acoustic Guitar Humidifier Manual

611075

This humidifier is designed to protect your guitar from dry conditions.

Simply suspend the humidifier by placing between the middle strings; the humidifier will release moisture evenly and slowly.

Fill the humidifier from the top opening using distilled water approximately once a month.

The frequency in which the humidifier needs to be refilled depends on the atmospheric conditions.

Distilled water should be used (not tap water). It is best to maintain a temperature of 70° Fahrenheit (21°Centigrade).
